

ABSTRACT OF THE DISCLOSURE

An apparatus and method of adjusting the vertical position of a cant sawbox relative to a cant feed axis includes a pair of pivotable arms mounted on a base that is slidable along a horizontal axis with each arm pivotably connected to a lower portion of the sawbox; a device upstream of the sawbox detects the thickness and calculates the mid point of the incoming cant and then effects movement of the sawbox so that the midline of the cant coincides with the feed axis.
